

- ◆ **LUER LOCK NEEDLE** provides up to a maximum of 10mm tissue penetration for increased safety.
- ◆ **SAFETY CLIP** prevents accidental deployment of the needle tip

- ◆ **REMOVABLE FINGER RING** can be re-sited at Position 1 or left as supplied in Position 2 to give best individual control and comfort during use.

Rocket® Pudendal and Paracervical Block Needles provide a safe and controllable method for delivering a pudendal or paracervical nerve block.

This route typically provides satisfactory perineal anaesthesia for normal delivery, low forceps manipulation and episiotomy.

The advantage of this approach over a major conduction block is the lack of circulatory and respiratory disturbance.

Typically the course and duration of labour are unaffected, even though there may be some impairment of the perineal-diaphragmatic-abdominal reflex.

Where there is concern about fetal compromise, either tested effective anaesthesia or, if time does not allow this, a pudendal block combined with local anaesthetic to the perineum can be used during instrumental birth.
